$P_p = 100 \text{ W/person}$

a) # of people = $\frac{1 \text{ person}}{100 \text{ W}} \times \frac{4.00 \times 10^3 \text{ W}}{\text{clothes dryer}} = 40 \text{ people/clothes dryer}$

b) # of people = $\frac{1 \text{ person}}{100 \text{ W}} \times \frac{800 \times 10^6 \text{ W}}{\text{power plant}} = 8 \times 10^6 \text{ people}$

Question 4:
The heights of 50 students, measured to the nearest centimeters, have been found to be as follows:
151 154 156 158 159 161 162 163 164 165 166 167 168 169 170 171 172 173 174 175 176 177 178 179 180 181 182 183 184 185 186 187 188 189 190 191 192 193 194 195 196 197 198 199 200 201 202 203 204 205 206 207 208 209 210 211 212 213 214 215 216 217 218 219 220 221 222 223 224 225 226 227 228 229 230 231 232 233 234 235 236 237 238 239 240 241 242 243 244 245 246 247 248 249 250 251 252 253 254 255 256 257 258 259 260 261 262 263 264 265 266 267 268 269 270 271 272 273 274 275 276 277 278 279 280 281 282 283 284 285 286 287 288 289 290 291 292 293 294 295 296 297 298 299 300 301 302 303 304 305 306 307 308 309 310 311 312 313 314 315 316 317 318 319 320 321 322 323 324 325 326 327 328 329 330 331 332 333 334 335 336 337 338 339 340 341 342 343 344 345 346 347 348 349 350 351 352 353 354 355 356 357 358 359 360 361 362 363 364 365 366 367 368 369 370 371 372 373 374 375 376 377 378 379 380 381 382 383 384 385 386 387 388 389 390 391 392 393 394 395 396 397 398 399 400 401 402 403 404 405 406 407 408 409 410 411 412 413 414 415 416 417 418 419 420 421 422 423 424 425 426 427 428 429 430 431 432 433 434 435 436 437 438 439 440 441 442 443 444 445 446 447 448 449 450 451 452 453 454 455 456 457 458 459 460 461 462 463 464 465 466 467 468 469 470 471 472 473 474 475 476 477 478 479 480 481 482 483 484 485 486 487 488 489 490 491 492 493 494 495 496 497 498 499 500

(i) Represent the data given above by a grouped frequency distribution table taking the class intervals as 160 - 165, 165 - 170, etc.

(ii) What can you conclude from these heights from the table?

Answer 4:

(i) A grouped frequency distribution table has to be constructed taking class intervals 160 - 165, 165 - 170, etc. By observing the data given above, the required table can be constructed as follows:

Height (in cm)	Number of students (Frequency)
160 - 165	11
165 - 170	9
170 - 175	14
175 - 180	10
180 - 185	8
185 - 190	5
Total	50

(ii) It can be concluded that more than 50% of the students are shorter than 165 cm.

YUMPU automatically turns print PDFs into web optimized ePapers that Google loves. Copy Exercises 32.1 Electrical Forces and Charges (pages 645-646) Extended embed settings Electric current is the rate at which electrons move across a conductor. Electric current is measured in amperes, which is the SI unit for current. Electrons are tiny particles that reside within a substance's molecular structure. These electrons are securely gripped at times and loosely held at other times. When the nucleus holds electrons loosely, they can move freely inside the body's confines. Because electrons are negatively charged particles, as they travel, several charges move with them, and this movement of electrons is referred to as an electric current. It's worth noting that a substance's ability to conduct electricity is determined by the number of electrons it can move. Some materials are better at allowing current to flow than others. Materials are classed as conductors or insulators depending on their capacity to conduct electricity. Conductors With the application of voltage, electrical charge carriers, mainly electrons, travel easily from atom to atom in an electrical conductor. The ability to transport something, such as electricity or heat, is referred to as conductivity. In ordinary life, pure elemental silver is the best electrical conductor. Copper, steel, gold, aluminum, and brass are all excellent conductors of electricity. Solid metals molded into wires or engraved onto circuit boards are used as conductors in electrical and electronic systems. Some liquids are excellent conductors of electricity. Mercury is a great illustration of this. A fair conductor is a saturated salt-water solution. Because the atoms are too far apart for a free interchange of electrons, gases are typically poor conductors. If a gas sample has a large number of ions, however, it can act as a fair conductor. Substances known as semiconductors are good conductors in some situations but poor conductors in others. Semiconductor materials include silicon, germanium, and different metal oxides. Both electrons and so-called holes (electron absences) operate as charge carriers in semiconductors. Some metals conduct electricity better at extremely low temperatures than any other known substance at room temperature. Superconductivity is the name given to this phenomenon, and a substance that exhibits it is known as a superconductor. You're Reading a Free Preview Page 3 is not shown in this preview.

RD Sharma Class 8 Solutions - RD Sharma Solutions for Class 8 Maths include answers to all the exercises of RD Sharma Class 8 Maths book in a stepwise manner. RD Sharma is one of the best reference books when it comes to Maths. With this book, Class 8 students can revise Maths concepts easily and prepare themselves for their exams. The best answers are voted up and rise to the top. Two Dimensional Motion If only two out of three coordinates specifying the position of the object changes with respect Chapter 2 Test Review 2014 - Answer Key Updated: 17-Oct-14 Page 2 of 11 5.
